QCMS Mobile · Android App Designs (R28 proposal) · Sheet 1 of 2

Four Star Industries · Teal Material design (same as the web app) · Native Android, Material 3, one-hand use, offline queue, dark-mode ready · Screens: Login, Home / KPI, PO Approval, PO Preview & Send choice

1 · Login. Company name and plant shown. Fingerprint / face unlock after the first password login. Password is never stored on the phone (secure token in Android Keystore).

2 · Home / KPI. Numbers first (as on the web KPI page). "Needs your action" list opens the exact record. The + button opens quick entry: inspection, photo upload, inward.

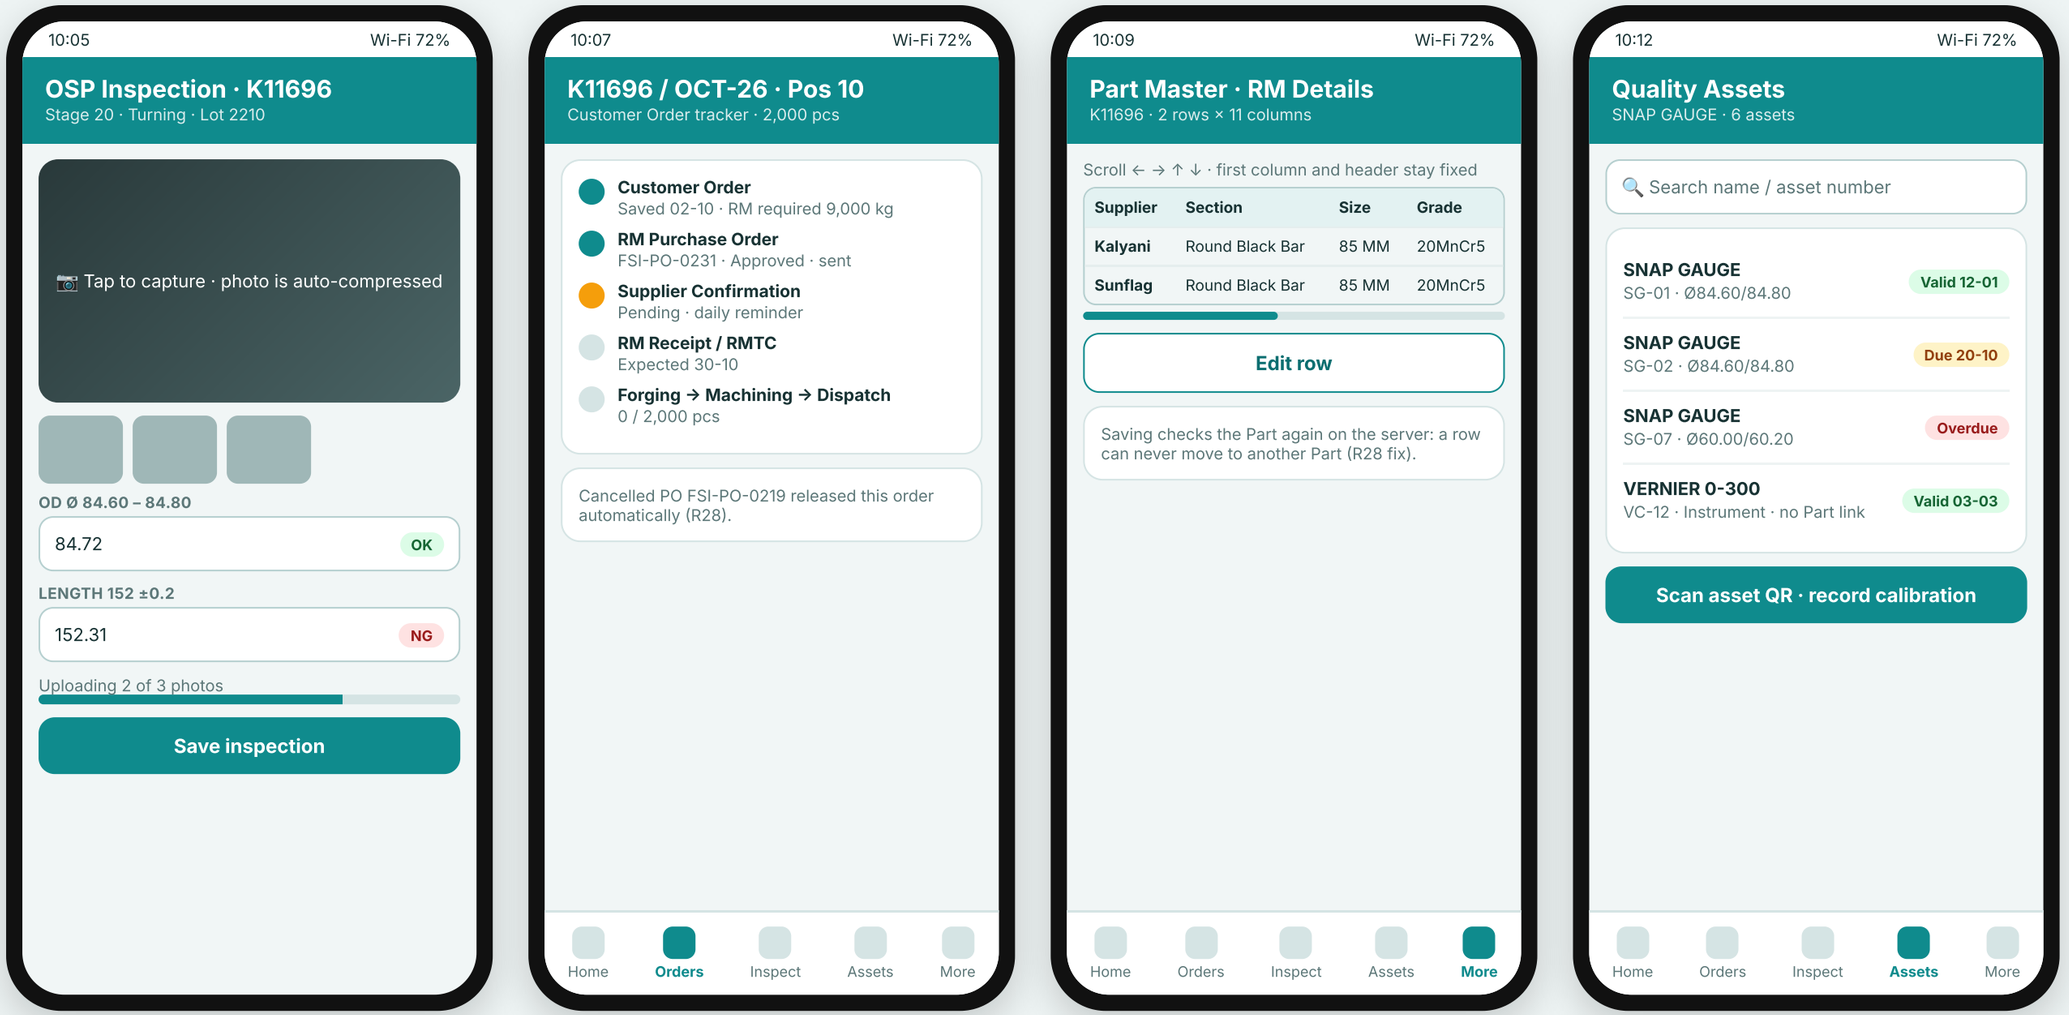

3 · PO Approval list. Filter chips with counts, quantity and value on each card, revised POs marked. Swipe right to approve, tap to open the full preview.

4 · PO Preview & send choice. The real PO PDF before approval. Print sections can be ticked on and off. Choose whether to email the supplier now or later. Reject needs a reason.

Primary teal #0F8B8D · Dark #0B6E70 · Background #F1F6F6 · Pending · Approved / OK · Rejected / Overdue

QCMS Mobile · Android App Designs (R28 proposal) · Sheet 2 of 2

Screens: Inspection entry with camera, Customer Order tracker, Scrollable data grid, Quality Asset / Calibration · Offline: entries are queued and sent when the network returns

5 · Inspection entry. Camera upload with progress and an automatic retry when offline. Each value is checked against the layout tolerance as you type (OK / NG). Large touch targets for gloved hands.

6 · Customer Order tracker. Every stage with its status and the linked document number. Each stage opens that record.

7 · Data grids. Every table scrolls in both directions with a fixed header and first column, and shows a scroll bar. Tap a row to edit it in a bottom sheet instead of tiny cells.

8 · Quality Assets & Calibration. The same name is allowed and the unique Asset Number tells them apart. Instruments and equipment are calibrated directly without a Part link. Scan the asset QR code to record a calibration.

Build plan after approval: Android 8+ · Material 3 · Kotlin · Supabase auth + REST (same RLS as web) · offline queue (WorkManager) · camera (CameraX) · biometric unlock · APK built automatically by GitHub on every main push (QCMS-FIRST-APP-APK)
